Longwater Increases Well Production 900 Percent with Greenwell's Well Stimulation and Asset Management Services

HOUSTON, Sept. 9, 2014—[Greenwell Energy Solutions](#) (Greenwell), an independent specialty provider of proprietary-blended chemicals and environmental services, announced production results based on its services deployed for Longwater's Four Winds Number 3 well. Greenwell deployed its G-Terminator™ well stimulation and cleanout service and the operator installed a higher capacity pump to boost the well's production from one barrel per day (bbl/day) to 10 bbl/day. Longwater LLC operates wells in the Brookshire Salt Dome.

"I worked over the well in the past but was unable to increase production beyond just a few weeks," said Wayne Hayes, owner of Longwater. "I needed a solution that would boost production immediately and maintain the increase."

"The well was blocked with heavy debris that severely limited production," said Ron Long, vice president of operations for Greenwell. "After our service boosted production, we had to upgrade the pump to keep up with the increased fluid volumes."

Greenwell deployed its G-Terminator well stimulation and cleanout service that combined a custom-blended, nanoemulsion fluid with a proprietary-designed oscillation tool. The service dissolved the well's scale, paraffin and other drilling debris. Greenwell managed all logistics and third parties for the well cleanout service and pump installation including the coil tubing company, workover rig, pump manufacturer and vacuum truck services.

"Greenwell has some of the best field personnel I've ever worked with," continued Hayes. "Their program engineer did all of the leg work and his knowledge and professionalism was impressive. They told me what they were going to do and they got it done. My well has not produced like this in years. As handling capacity increases, I'll call on Greenwell to bring my non-producing wells back on line."

The G-Terminator addresses the most common blockage obstacles faced during pre-frac and post-frac completions and production. While alternative solutions, such as jet nozzles and high velocity tools bypass blockage, the G-Terminator completely removes material. It gently breaks up wellbore damage and enhances the native permeability found in formations. Additionally, case studies prove it has higher productivity rates, both in the short-term and long-term, compared to using chemicals alone.

About Greenwell Energy Solutions

Greenwell Energy Solutions is an independent specialty supplier delivering proprietary-blended chemicals, water treatment and environmental services for the upstream energy industry. Its services span well stimulation, pressure control/flowback services, disposal well services and fully managed secondary containment that reduce clients' environmental impact and operating costs. Through unbiased testing at partner and third-party labs, Greenwell is able to ensure its solutions provide consistent quality, performance and durability. The company dedicates countless R&D hours to designing environmentally-friendly chemicals and solutions that perform reliably on every project. For more information, visit greenwellsolutions.com.
